Research Interests

My research centers on surfaces (real two-dimensional manifolds), with an emphasis on the interplay between geometry, combinatorics, and dynamics. In particular, I study translation surfaces and, more broadly, flat cone surfaces, together with their moduli spaces.

In Preparation

L^∞-Delaunay cells and linear subvarieties in the moduli space of Abelian differentials, *with Vincent Delecroix and Bradley Zykoski*.

Programming Project

I use computational methods in my research, often with **SageMath**. Currently, I am working with Vincent Delecroix on the computation of real linear subvarieties in the moduli spaces of Abelian differentials. More precisely, we develop algorithms to verify that a given germ defines a real linear subvariety. We also compute the boundary of a real linear subvariety in the multi-scale compactification. This project is being implemented in the package **veerer**.
